

# GradPilot AI

Full Site Audit · Progress Report · Plan for the Week

The career co-pilot for international students in the UK

|              |                                 |        |                             |
|--------------|---------------------------------|--------|-----------------------------|
| Prepared for | Diwash Poudel — Founder & CEO   | Date   | 16 June 2026                |
| Product      | GradPilot AI (gradpilotali.com) | Stage  | Early MVP / Pre-launch      |
| Platform     | Base44 + Supabase + Stripe      | Entity | GradPilot AI Ltd, London UK |

## 1 · Executive Summary

GradPilot AI is a feature-complete **product foundation** built on the Base44 platform, with a parallel Supabase database and Stripe billing scaffolding. The marketing website and the in-app experience both exist and are populated with real content — a 30-job board of genuine UK employers that sponsor visas, 10 mentor profiles, 10 SEO blog articles, and a fully fleshed-out CMS. In short: **the house is built and furnished**.

What is missing is **occupants**. There are 5 registered users (4 beyond the founder) and effectively zero product engagement so far — 0 tracked applications, 0 CV analyses, 0 subscriptions. The single most important fact in this report: the build is far ahead of the traction. This week should pivot from building to **launching, hardening, and getting real users through the door**.

### Overall verdict

**Strong build, thin traction — ready to launch once a handful of security & data-hygiene items are closed.**

## 2 · What We've Achieved So Far

A genuinely broad product has been assembled. The platform already covers the full international-student-to-UK-graduate-job journey:

### Product surface that is built

| Area              | What's live                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Jobs & Visa       | Job board (30 real listings: Spotify, Wayve, Wise, Palantir, Goldman Sachs...), Graduate-Route / Skilled-Worker sponsorship flags, saved jobs, job alerts, employer insights. |
| CV & Applications | CV analysis & AI rewrite, scoring, cover-letter generation, application tracker with interview/offer pipeline & sponsorship status.                                           |
| AI & Interview    | AI career chat assistant, interview-prep sessions with scored feedback, and an interview-question bank (behavioural / technical / visa-related).                              |
| Mentorship        | 10 mentor profiles with visa-journey stories + mentor-request workflow.                                                                                                       |

|                 |                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Life in the UK  | Room/housing listings, visa-deadline alert engine, and a relocation checklist (bank account, NI number, GP, address).                                                    |
| Monetisation    | Three pricing tiers, Stripe subscription model, and per-feature monthly usage limits (free vs paid gating).                                                              |
| Marketing & CMS | Full landing site (hero, features, how-it-works, pricing, FAQ, about/founder story, testimonials) + 10-post SEO blog + waitlist capture — all editable via CMS entities. |
| Admin           | Support-ticket system, announcements, in-app notifications, and usage tracking.                                                                                          |

## Content & data already seeded

- **30 job listings** from real UK employers with working application links and visa-sponsorship metadata.
- **10 published/draft blog articles** targeting high-intent SEO keywords (Graduate Route visa, UK CV writing, sponsor register, NI number, rental scams, graduate schemes, bank accounts, NHS registration).
- **10 mentor profiles, 8 FAQs, 3 pricing plans**, 7 platform features, 4 'how it works' steps and the full company/founder story — the marketing site is content-complete.
- Clear brand & positioning: London-registered **GradPilot AI Ltd**, founder-led story, live domains (gradpilotai.com / app.gradpilotai.com).

## 3 · How Well the Website Is Working

### Health scorecard

| Dimension                 | Rating     | Notes                                                                                          |
|---------------------------|------------|------------------------------------------------------------------------------------------------|
| Feature completeness      | STRONG     | 34 modules covering the whole journey; little is conceptually missing.                         |
| Content readiness         | STRONG     | Marketing site and blog are populated and on-brand.                                            |
| Marketing site / SEO      | GOOD       | Live domain, blog, meta descriptions, target keywords set. Indexing/analytics need confirming. |
| Data integrity            | NEEDS WORK | Real data mixed with sample/placeholder rows (example.com waitlist, sample mentors).           |
| Security posture          | NEEDS WORK | 6 Supabase security warnings (RLS & SECURITY DEFINER). None critical, all fixable.             |
| DB performance / RLS      | NEEDS WORK | 169 advisor lints — mostly duplicate permissive policies & un-optimised auth checks.           |
| User traction             | WEAK       | 5 users, ~0 active product usage, 0 subscribers. This is the real gap.                         |
| Code backup / portability | WEAK       | Git repo is empty — no exported source or backup outside Base44.                               |

### Issues found (prioritised)

| # | Issue                                                                                                                                 | Severity | Fix                                                                                   |
|---|---------------------------------------------------------------------------------------------------------------------------------------|----------|---------------------------------------------------------------------------------------|
| 1 | SECURITY DEFINER functions <code>handle_new_user()</code> & <code>is_admin()</code> are callable by anon/authenticated roles via RPC. | HIGH     | Revoke EXECUTE or switch to SECURITY INVOKER.                                         |
| 2 | Waitlist insert RLS policy uses <code>WITH CHECK (true)</code> — unrestricted writes.                                                 | MED      | Add rate-limit / column constraints.                                                  |
| 3 | <code>set_updated_at</code> function has a mutable <code>search_path</code> .                                                         | MED      | Pin <code>search_path</code> on the function.                                         |
| 4 | 141 duplicate 'permissive' RLS policies + 17 un-optimised <code>auth.uid()</code> calls + 8 unindexed foreign keys.                   | MED      | Consolidate policies; wrap auth in <code>(select auth.uid())</code> ; add FK indexes. |
| 5 | Duplicate empty 'GradPilot AI' Base44 app exists alongside the real one.                                                              | LOW      | Delete/archive the empty duplicate.                                                   |
| 6 | Sample data (example.com waitlist, sample mentors) mixed with real records; ICO registration shows PENDING.                           | LOW      | Purge samples before launch; complete ICO/GDPR.                                       |
| 7 | No source/code backup outside Base44 (git repo empty).                                                                                | LOW      | Export and commit a backup snapshot.                                                  |

Note: the architecture currently keeps data in **two places** (Base44 entities, which the live app reads, and a near-empty Supabase mirror). Decide on a single source of truth before scaling to avoid drift.

# 4 · The Plan for This Week (16–22 June)

Theme of the week: **stop building, start launching**. The product is ready enough; the priority is hardening it for real users and getting those users in. Below is a day-by-day plan plus the three outcomes that define success.

## Three outcomes that define a good week

- **Secure & clean:** all HIGH/MED security items closed and sample data purged — safe to put in front of strangers.
- **Launch-ready:** a working sign-up → onboarding → first-value path, plus analytics so we can see usage.
- **First 25 real users:** a concrete acquisition push (university communities, socials, waitlist activation).

## Day-by-day

| Day     | Focus                   | Key tasks                                                                                                                                                                                        |
|---------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mon–Tue | Security & data hygiene | Fix SECURITY DEFINER functions, waitlist RLS, search_path; purge example.com/sample rows; delete duplicate Base44 app; export a code/data backup to git.                                         |
| Wed     | DB hardening            | Consolidate duplicate RLS policies, optimise auth.uid() checks, add the 8 missing FK indexes; decide Base44-vs-Supabase source of truth.                                                         |
| Thu     | Launch readiness        | Walk the full sign-up → onboarding → first job-save / first CV-analysis flow; fix friction; wire up analytics (GA4 / PostHog) + key conversion events; confirm Stripe checkout works end-to-end. |
| Fri     | Content & SEO           | Publish the 5 draft blog posts, verify meta/sitemap, submit to Google Search Console; refresh job board (add ~10 new sponsoring employers, deactivate expired).                                  |
| Sat–Sun | Acquisition push        | Email the waitlist with a launch invite; post in international-student communities & socials (LinkedIn/TikTok/Instagram); ask the 4 existing users for feedback. Target: 25 real sign-ups.       |

## Priority matrix

| Do first (high impact, low effort)                                                                                                                                        | Schedule (high impact, higher effort)                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Fix the 3 security warnings</li><li>• Purge sample data</li><li>• Publish draft blog posts</li><li>• Email the waitlist</li></ul> | <ul style="list-style-type: none"><li>• Analytics + conversion tracking</li><li>• Onboarding flow polish</li><li>• RLS/index optimisation</li><li>• Acquisition campaign</li></ul> |
| Quick wins (lower impact, low effort)                                                                                                                                     | Later (lower impact, higher effort)                                                                                                                                                |
| <ul style="list-style-type: none"><li>• Delete duplicate app</li><li>• Commit code backup</li><li>• Refresh job listings</li></ul>                                        | <ul style="list-style-type: none"><li>• Base44 → Supabase consolidation</li><li>• Complete ICO registration</li><li>• Mentor-matching automation</li></ul>                         |

**Bottom line:** GradPilot AI has done the hard part — it is a complete, well-structured product with real content and a clear mission. The next chapter is not more features; it is **hardening, launching, and earning the first cohort of real users**. Close the security items, clean the data, turn on analytics, and spend the weekend driving sign-ups.
